# Globe Valve

The Belimo globe valve assemblies provide high close-off pressure, precise positioning, easy installation, field adjustability, and reliable operation. The G2B, G2S and G3B series NPT threaded globe valves are easy to identify with the Belimo metal name plate stating the rating and certification details. They feature ANSI Class VI leakage to ensure tight close-off, accurate modulation at low flow with rangeability rating of 100:1, and pressure compensated valve design for 2-way valve bodies to achieve specified close-off with low actuator torque. G2S series with maximum 50 psi differential pressure specification accommodates 100 psi inlet steam applications.

The Belimo globe valve actuators are designed to withstand the rigorous demands of many HVAC applications. With its innovative quick connect coupler, the globe valve actuator can be retrofitted and installed and adapted in no time. The Belimo globe valve actuators incorporate not only strength but are highly adaptable making selection, installation and service hassle-free.

# **Mode of Operation**

The control valve is operated by an electronic actuator that responds to a standard voltage for on/off control, by a modulating 2...10 V/ 4...20 mA, floating point control system. The actuator will then move the plug of the valve to the position dictated by the control signal thus changing the flow.

### **Product Features**

New G2 and G3 globe valves offer a modified equal percentage flow characteristic for a wide variety of HVAC applications. Capable of being used for heating, cooling, and steam service. Repack kits are available to extend the life of the valve without full replacement.

# **Globe Valve Flanged Body**

The G...(C)(CS)(LCS) Series valve is a pressure compensated valve that allows high close-off ratings while utilizing standard actuation.

### **Mode of Operation**

The control valve is operated by an electronic actuator that responds to a standard voltage for on/off control, a modulating 2...10 V/4...20 mA, or floating point control system. The actuator will then move the plug of the valve to the position dictated by the control signal thus changing the flow.

### **Product Features**

Equal percentage and linear flow curve options available for a wide variety of HVAC applications. Capable of being used for heating, cooling, and steam service. Repack and rebuild kits are available to extend the life of the valve without full replacement.

# **Mode of Operation**

The control valve is operated by an electronic actuator that responds to a standard voltage for on/off control, a modulating 2...10 V/4...20 mA, or floating point control system. The actuator will then move the plug of the valve to the position dictated by the control signal thus changing the flow

# **Product Features**

Equal percentage (G6) and linear (G7) flow curve options available for a wide variety of HVAC applications. Capable of being used for heating, cooling, and steam service. Repack and rebuild kits are available to extend the life of the valve without full replacement.

# **Actuator Specifications**

# Two-way Three-way Mixing Three-way Diverting

# Installation

- Inspect shipping package, valve, linkage, and actuator for physical damage. If shipping damage has occurred notify appropriate carrier. Do not install.
- 2. If a replacement, remove existing valve, linkage and actuator from the piping system.
- If actuator and linkage are removed, they must be reinstalled correctly. The actuator must be rotated so that the valve sits properly for close off.
- 4. Install valve with the proper ports as inlets and outlets. Check that inlet and outlet of 2-way valves are correct; check that the "A", "B", and "AB" ports of 3-way valves are piped correctly for mixing or diverting. See supplied drawings on previous page.
- 5. Blow out all piping and thoroughly clean before valve installation.
- 6. Clean male pipe threads with wire brush and rag. If threads have been damaged or exposed to weather, running a tap or die over the threads may straighten them. Clean pipes, threads, and valve threads before installation; check for any foreign material that can become lodged in trim components. Strainers should be cleaned after initial startup.
- 7. Pipe sealing compound should be applied sparingly after cleaning and may not be applied to the two lead threads of a screwed pipe, which are innermost inside the valve. Sealing compound is to be placed on male threads only. The purpose is to lubricate the pipes when tightening.
- 8. Valve must be installed per the mounting drawings shown.
- 9. Start the connection by turning the valve or pipe by hand as far as possible. Be certain the threads mate by the "feel" of the connection.
- 10. Use wrenches to tighten the valve to the pipe. Do not over tighten or strip the threads. Two wrenches are necessary to avoid damaging the valve.
- Two-way valve Normally Open or Closed configurations must be verified by examining both the mechanical drawings and the valve and actuator. See details below.
- 12. Three-way valve Normally Open or Closed configurations for the Control Port and the Bypass Port must be verified by examining both the mechanical drawings and the valve and actuator.

### Warning!

Valve should not be used for combustible gas applications. Gas leaks and explosions may result. Do not install in systems which exceed the ratings of the valve.

- Avoid installations where valve may be exposed to excessive moisture, corrosive fumes, vibration, high ambient temperatures, elements, or high traffic areas with potential for mechanical damage.
- Valve assembly location must be within ambient ratings of actuator.
- The valve assembly will require heat shielding, thermal isolation, or cooling
  if combined effect of medium and ambient temperatures conduction,
  convection, and radiation is above 122°F for prolonged time periods at the
  actuator.
- · Strainers should be installed before coil and valve.
- Visual access must be provided. Assembly must be accessible for routine scheduled service. Contractor should provide unions for removal from line and isolation valves.
- Avoid excessive stresses. Mechanical support must be provided where reducers have been used and the piping system may have less structural integrity than full pipe sizes.
- Sufficient upstream and downstream piping runs must be provided to ensure proper valve capacity and flow response. Five diameters in each direction are recommended.
- Life span of valve stems and packing is dependent on maintaining non-damaging conditions. Poor water treatment or filtration, corrosion, scale, other particulate can result in damage to trim components. A water treatment specialist should be consulted.
- Normal thread engagement between male pipe thread and valve body should be observed. Pipe run that is in too far will damage the valve.

# INSTALLATION

Valve must be installed in these orientations only.

# **Linear Actuators**

# **UGLK Linkage**

# **Steam Applications**

Assembly can be mounted horizontally or vertically for water applications. For steam applications, the valve cannot be mounted on a vertical section of pipe and should always be mounted at between 0° to 45° relative to the pipe. Never install with actuator below pipe.

# **Installation Instructions**

# **Globe Valve Flanged Body**

# Warning!

Valve should not be used for combustible gas applications. Gas leaks and explosions may result. Do not install in systems which exceed the ratings of the valve.

- Avoid installations where the valve may be exposed to excessive moisture, corrosive fumes, vibration, high ambient temperatures, elements, or high traffic areas with the potential for mechanical damage.
- · Valve assembly location must be within ambient ratings of the actuator. If the temperature is below -22°F, a heater is required.
- The valve assembly will require heat shielding, thermal isolation, or cooling at the actuator if the combined effect of medium and ambient temperatures (conduction, convection, and radiation) is above 122°F for prolonged time periods.
- · Strainers should be installed before coil and valve.
- Visual access must be provided. Assembly must be accessible for routine service. Contractor should provide unions for removal from line and isolation valves.
- Avoid excessive stresses. Mechanical support must be provided where reducers have been used and the piping systems may have less structural integrity
  than full pipe sizes.
- · Vertical pipes with valves and dual actuators may require linkage support.
- Sufficient upstream and downstream piping runs must be provided to ensure proper valve capacity and flow response. Five diameters in each direction
  are recommended.
- The lifespan of the valve stems and packing is dependent on maintaining non-damaging conditions. Poor water treatment or filtration, corrosion, scale or
  particulate deposits can result in damage to trim components. A water treatment specialist should be consulted.
  - 1. Inspect shipping package, valve, linkage, and actuator for physical damage. If shipping damage has occurred, notify appropriate carrier. Do not install.
  - 2. If this is a replacement, remove the existing valve, linkage, and actuator from the piping system.
- 3. If actuator and linkage are removed, the replacements must be installed correctly to ensure close-off is achieved when commanded closed, and fail-safe actuator moves the stem to the proper fail-safe position with a loss of power.
- 4. Install valve with the proper ports as inlets and outlets. See piping charts on page 18. Check that inlet and outlet of the 2-way valves are correct; check that the "A", "B", and "AB" ports of 3-way valves are piped correctly. Flow direction arrows must be correct.
- 5. Blow out all piping and thoroughly clean before valve installation.
- 6. Clean male pipe threads with wire brush and rag. If threads have been damaged or exposed to weather, running a tap or die over the threads may straighten them. Clean pipes, threads, and valve threads before installation. Check for any foreign material that can become lodged in trim components. Strainers should be cleaned after initial startup.
- 7. Pipe sealing compound may not be applied to either flange or gasket. Flanged bodies must be used with flanges which are rated for the service. 125 lb flanges have flat faces and may not be bolted to raised face flanges. Gasket ratings must comply with application specifications for: medium, temperature, and pressure.
- 8. Valve must be installed with the stem above horizontal to avoid water damage to the actuator.
- 9. Tighten bolts alternatively and evenly around the flange.
- 10. 2-way valve Normally Open (NO) or Normally Closed (NC) configurations must be verified by examining both the mechanical drawings and the valve and actuator.
- 11. 3-way valve Normally Open (NO) or Normally Closed (NC) configurations for the control port and the bypass port must be verified by examining both the mechanical drawings and the valve and actuator.

Check specifications for every application to be sure of ports and designations.

# U, L, and C designations

U is for Upper, the control port. L is for Lower, the bypass port. C is for Common.

Viewed with the bonnet upwards; the U port is on the left, the L port is on the bottom, and the C port is on the right. With the stem up the L port is open to Common; and with the stem down the U port is open to Common.
